Repetition Thresholds

- A β -repetition is a repetition of exponent β
- A word is α^+ -free if it contains no β -repetition such that $\beta > \alpha$
- \blacksquare A word is $\alpha\text{-free}$ if it contains no $\beta\text{-repetition}$ such that $\beta\geq\alpha$
- For k ≥ 2, the repetition threshold RT(k) for k letters is the smallest α such that there exists an infinite α⁺-free word over a k-letter alphabet

 The notion of repetition thresholds was initiated by Dejean [10] in 1972

Repetition Thresholds - Results

(ロ)、(型)、(E)、(E)、 E) の(の)

Repetition thresholds for words are completely solved

Repetition Thresholds - Results

Repetition thresholds for words are completely solved

Theorem 1

(i)
$$\operatorname{RT}(2) = 2$$
 [10];
(ii) $\operatorname{RT}(3) = \frac{7}{4}$ [10];
(iii) $\operatorname{RT}(4) = \frac{7}{5}$ [16];
(iv) $\operatorname{RT}(k) = \frac{k}{k-1}$, for $k \ge 5$ [3, 7, 8, 9, 13, 14, 16, 17].

 Study of non-repetitiveness has been generalized to graphs by Currie [4, 5] and Alon et al. [2]

- Study of non-repetitiveness has been generalized to graphs by Currie [4, 5] and Alon et al. [2]
- For a k-vertex coloring of a graph, a sequence of colors on a non-intersecting path is called a factor

- Study of non-repetitiveness has been generalized to graphs by Currie [4, 5] and Alon et al. [2]
- For a k-vertex coloring of a graph, a sequence of colors on a non-intersecting path is called a factor
- A vertex coloring is said to be α^+ -free (resp. α -free) if every factor is α^+ -free (resp. α -free)

For a k-vertex colored graph G, the repetition threshold is

 $\operatorname{RT}(k,G) = \inf_{k \text{-coloring } c} \sup \left\{ \exp(w) \, | \, w \text{ is a factor in } c \right\} \, .$

For a k-vertex colored graph G, the repetition threshold is

 $\operatorname{RT}(k,G) = \inf_{k \text{-coloring } c} \sup \left\{ \exp(w) \, | \, w \text{ is a factor in } c \right\} \, .$

The repetition threshold over a whole class of graphs G is defined as

$$\operatorname{RT}(k,\mathcal{G}) = \sup_{G\in\mathcal{G}}\operatorname{RT}(k,G).$$

 For the class of paths P the repetition thresholds are known, since

 $\operatorname{RT}(k,\mathcal{P}) = \operatorname{RT}(k)$

Repetition Thresholds of Cycles - \mathcal{C}

$$T$$
) = $\frac{7}{2}$;
(*ii*) RT(3, T) = 3;
(*iii*) RT(k, T) = $\frac{3}{2}$, for $k \ge 4$.

Repetition Thresholds of Subdivisions - \mathcal{S}

Theorem 5 ([15])

(*i*) RT(2, S) =
$$\frac{7}{3}$$
;
(*ii*) RT(3, S) = $\frac{7}{4}$;
(*iii*) RT(k, S) = $\frac{3}{2}$, for $k \ge 4$.

A subdivision of a graph G is a graph obtained from G by a sequence of edge subdivisions. By a graph subdivision, we always mean a "large enough" subdivision

Repetition Thresholds of Caterpillars - \mathcal{CP}

 A caterpillar is a tree such that the graph induced by the vertices of degree at least 2 is a path (we call it a backbone)

Theorem 6 (BL, Ochem, Pinlou, 2018⁺)

(*i*) RT(2,
$$CP$$
) = 3;
(*ii*) RT(3, CP) = 2;
(*iii*) RT(k, CP) = $\frac{3}{2}$, for $k \ge 4$.

RT of Subcubic Caterpillars - \mathcal{CP}_3

 Bounding the degree of caterpillars to 3 changes the behavior when the alphabet sizes grow

(ロ)、(型)、(E)、(E)、 E) のQの

RT of Subcubic Caterpillars - \mathcal{CP}_3

 Bounding the degree of caterpillars to 3 changes the behavior when the alphabet sizes grow

Theorem 7 (BL, Ochem, Pinlou, 2018⁺)

(i)
$$\operatorname{RT}(2, \mathcal{CP}_3) = 3;$$

(ii) $\operatorname{RT}(3, \mathcal{CP}_3) = 2;$
(iii) $\operatorname{RT}(4, \mathcal{CP}_3) = \frac{3}{2};$
(iv) $\operatorname{RT}(5, \mathcal{CP}_3) = \frac{4}{3};$
(v) $\operatorname{RT}(k, \mathcal{CP}_3) = 1 + \frac{1}{\lfloor \frac{k}{2} \rfloor}, \text{ for } k \ge 6.$

- First: $1 + \frac{1}{t} \leq \operatorname{RT}(3(2^{\lfloor t/2 \rfloor} 1), \mathcal{T}_3)$
- Take a full subcubic tree with $\lfloor \frac{t}{2} \rfloor$ levels

It has diameter at most t

- We prove it in a stronger form: $\operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3) \leq 1 + \frac{1}{t} \leq \operatorname{RT}(3(2^{\lfloor t/2 \rfloor} - 1), \mathcal{T}_3), t \geq 4$
- First: $1 + \frac{1}{t} \leq \operatorname{RT}(3(2^{\lfloor t/2 \rfloor} 1), \mathcal{T}_3)$
- Take a full subcubic tree with $\lfloor \frac{t}{2} \rfloor$ levels

- It has diameter at most t
- In a $(1 + \frac{1}{t})^+$ -free coloring, all vertices have distinct colors

- We prove it in a stronger form: $\operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3) \leq 1 + \frac{1}{t} \leq \operatorname{RT}(3(2^{\lfloor t/2 \rfloor} - 1), \mathcal{T}_3), t \geq 4$
- First: $1 + \frac{1}{t} \leq \operatorname{RT}(3(2^{\lfloor t/2 \rfloor} 1), \mathcal{T}_3)$
- Take a full subcubic tree with $\lfloor \frac{t}{2} \rfloor$ levels

- It has diameter at most t
- In a $(1 + \frac{1}{t})^+$ -free coloring, all vertices have distinct colors

• There are $3(2^{\lfloor t/2 \rfloor} - 1) + 1$ vertices

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

Second:
$$1 + \frac{1}{t} \ge \operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3)$$

- Second: $1 + \frac{1}{t} \ge \operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3)$
- Construct a $(1 + \frac{1}{t})^+$ -free coloring: to each vertex assign a color (γ, λ) , with $0 \le \gamma \le 2t + 1$ and $\lambda \in \{0, 1\}^{\lfloor (t-1)/2 \rfloor}$

- Second: $1 + \frac{1}{t} \ge \operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3)$
- Construct a $(1 + \frac{1}{t})^+$ -free coloring: to each vertex assign a color (γ, λ) , with $0 \le \gamma \le 2t + 1$ and $\lambda \in \{0, 1\}^{\lfloor (t-1)/2 \rfloor}$
- γ-component: Let w be a (1 + ¹/_t)⁺-free word on t + 1 letters. Let w' be obtained from w by doubling every letter (we distinguish the doubled letters)

- Second: $1 + \frac{1}{t} \ge \operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3)$
- Construct a $(1 + \frac{1}{t})^+$ -free coloring: to each vertex assign a color (γ, λ) , with $0 \le \gamma \le 2t + 1$ and $\lambda \in \{0, 1\}^{\lfloor (t-1)/2 \rfloor}$
- γ -component: Let w be a $(1 + \frac{1}{t})^+$ -free word on t + 1 letters. Let w' be obtained from w by doubling every letter (we distinguish the doubled letters) Example: if $w = a_1 a_2 a_3$ then $w' = a_1a'_1 a_2a'_2 a_3a'_3$

- Second: $1 + \frac{1}{t} \ge \operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3)$
- Construct a $(1 + \frac{1}{t})^+$ -free coloring: to each vertex assign a color (γ, λ) , with $0 \le \gamma \le 2t + 1$ and $\lambda \in \{0, 1\}^{\lfloor (t-1)/2 \rfloor}$
- γ-component: Let w be a (1 + 1/t)⁺-free word on t + 1 letters. Let w' be obtained from w by doubling every letter (we distinguish the doubled letters)
 Example: if w = a₁ a₂ a₃ then w' = a₁a'₁ a₂a'₂ a₃a'₃
- λ -component: for a vertex v, let $u_1, \ldots, u_{\lfloor (t-1)/2 \rfloor}$ be its *i*-th ancestors, $1 \le i \le \lfloor \frac{t-1}{2} \rfloor$.

- Second: $1 + \frac{1}{t} \geq \operatorname{RT}((t+1)2^{\lfloor (t+1)/2 \rfloor}, \mathcal{T}_3)$
- Construct a $(1 + \frac{1}{t})^+$ -free coloring: to each vertex assign a color (γ, λ) , with $0 \le \gamma \le 2t + 1$ and $\lambda \in \{0, 1\}^{\lfloor (t-1)/2 \rfloor}$
- γ-component: Let w be a (1 + ¹/_t)⁺-free word on t + 1 letters. Let w' be obtained from w by doubling every letter (we distinguish the doubled letters)
 Example: if w = a₁ a₂ a₃ then w' = a₁a'₁ a₂a'₂ a₃a'₃
- λ -component: for a vertex v, let $u_1, \ldots, u_{\lfloor (t-1)/2 \rfloor}$ be its *i*-th ancestors, $1 \le i \le \lfloor \frac{t-1}{2} \rfloor$. The λ -component is a the $\frac{t-1}{2}$ -dimensional binary vector with *i*-th component 0 if u_i is the left son of u_{i+1} and 1 otherwise. (If v does not have so many ancestors, we add 0's to the missing components.)

◆□ ▶ < 圖 ▶ < 圖 ▶ < 圖 ▶ < 圖 • 의 Q @</p>

• Suppose there is an α -repetition with $\alpha > t + \frac{1}{t}$

- Suppose there is an α -repetition with $\alpha > t + \frac{1}{t}$
- Suppose only one letter repeats, i.e. there is a factor axa with |ax| < t (there are two vertices u and v of the same color within distance less than t)

◆□▶ ◆□▶ ◆三▶ ◆三▶ 三三 のへぐ

- Suppose there is an α -repetition with $\alpha > t + \frac{1}{t}$
- Suppose only one letter repeats, i.e. there is a factor axa with |ax| < t (there are two vertices u and v of the same color within distance less than t)

- u and v must be on the same level, otherwise they are at distance at least 2t, due to γ

- Suppose there is an α -repetition with $\alpha > t + \frac{1}{t}$
- Suppose only one letter repeats, i.e. there is a factor axa with |ax| < t (there are two vertices u and v of the same color within distance less than t)

- u and v must be on the same level, otherwise they are at distance at least 2t, due to γ

- since they have the same λ , their common ancestor is at distance at least $\lfloor (t-1)/2 \rfloor + 1$ from each of them, so they are at distance at least $2(\lfloor (t-1)/2 \rfloor + 1) \ge t$, a contradiction.

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ 臣 の�?

Suppose that at least two letters repeat

- Suppose that at least two letters repeat
- Let $p = \ell_i \ell_{i-1} \dots \ell_1 u r_1 \dots r_j$ be the path supporting the repetition

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

- Suppose that at least two letters repeat
- Let $p = \ell_i \ell_{i-1} \dots \ell_1 u r_1 \dots r_j$ be the path supporting the repetition

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 = のへで

• Let
$$f(\ell_k)f(\ell_{k-1}) = f(r_{j-1})f(r_j)$$

- Suppose that at least two letters repeat
- Let $p = \ell_i \ell_{i-1} \dots \ell_1 u r_1 \dots r_j$ be the path supporting the repetition
- Let $f(\ell_k)f(\ell_{k-1}) = f(r_{j-1})f(r_j)$

- Suppose that at least two letters repeat
- Let $p = \ell_i \ell_{i-1} \dots \ell_1 u r_1 \dots r_j$ be the path supporting the repetition
- Let $f(\ell_k)f(\ell_{k-1}) = f(r_{j-1})f(r_j)$

Since ℓ_{k-1} is the parent of ℓ_k and r_{j-1} is the parent of r_j , the γ -components cannot match

- Suppose that at least two letters repeat
- Let $p = \ell_i \ell_{i-1} \dots \ell_1 u r_1 \dots r_j$ be the path supporting the repetition
- Let $f(\ell_k)f(\ell_{k-1}) = f(r_{j-1})f(r_j)$

- Since ℓ_{k-1} is the parent of ℓ_k and r_{j-1} is the parent of r_j , the γ -components cannot match
- So, all the vertices of *p* are on different levels, which means w' and consequently *w* are not $(1 + \frac{1}{t})^+$ -free, a contradiction
